Thermo-Dynamic® Steam Traps

for efficient condensate drainage of steam mains, steam tracing systems and industrial process equipment

spirax /sarco®

The world's FIRST Thermo-Dynamic® disc trap is still the world's BEST.

The Thermo-Dynamic® disc trap is one of the most popular steam traps on the market today. The cost effective, compact design makes the TD ideal for drainage of steam mains, steam tracing lines and small process equipment where size, as well as efficient operation are important.

Discharge from the TD is close to steam temperature; therefore, the steam space is kept free from condensate. The tight shut-off the TD provides prevents valuable steam from being wasted. These factors combine to optimize the steam system efficiency.

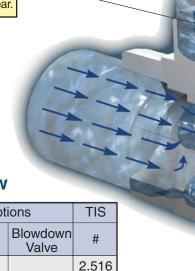

Spirax Sarco invented and patented the TD in 1953. Since then, the range has been refined to accommodate a variety of sizes and piping orientations and operating pressures up to 3625 psig.

Ceramic insulation minimizes the effect of adverse ambient conditions.

Hardened stainless steel disc shuts off tight between cycles.

Three outlet orifices ensure that the disc remains parallel to the seat for improved performance and reduced wear.

Thermo-Dynamic[®] Steam Trap Overview

^{*} BTD52L also available in 1/4" connection and with O.D. tube and tri-clamp connections.

How it works

On start-up incoming pressure raises the disc and cool condensate, plus air, is immediately discharged (A). Hot condensate flowing through the trap releases flash steam. High velocity creates a low pressure area under the disc and draws it toward the seat (B). At the same time there is a pressure build up of flash

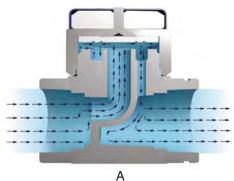

steam in the chamber above the disc which forces it down against the seats on the inner ring and closes the inlet. The disc also seats on the outer ring and traps pressure in the chamber (C). Pressure in the chamber is decreased by condensation of the flash steam and the disc is raised. The cycle is then repeated (D).

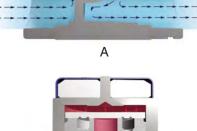

Turbulence grooves in disk ensure that the trap closes just before live steam reaches the inlet.

Induction hardened seating surfaces for longer life.

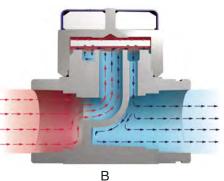

Metal-to-metal cap/body joint does not require gasketing.

Stainless steel body and cap. Electroless nickel plating (ENP) finish is standard on some models.

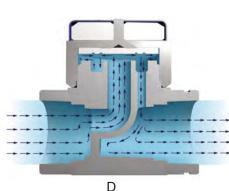

С

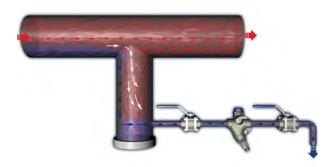

User benefits

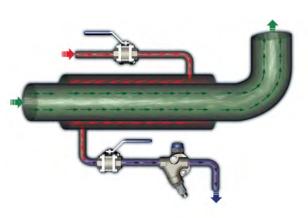

- Condensate is discharged close to steam temperature at all operating pressures.
- Withstands superheat, waterhammer, freezing, corrosive condensate and vibration.
- Only one moving part a stainless steel disc hardened for long life.
- Blast discharge with clean, tight shutoff
- Audible "click" as the disc seats. Performance is easily checked.
- Single piece stainless steel body eliminates internal gaskets and leak paths.
- Will work in any orientation.
- Available in swivel connector configuration for best orientation and simplified maintenance.

Typical Applications for Thermo-Dynamic® Steam Traps

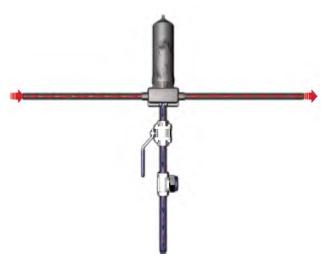

Condensate removal from steam mains

Instant removal of condensate prevents waterhammer and improves steam quality.

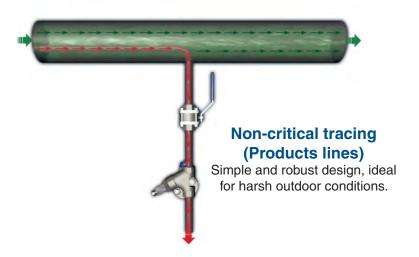

Critical tracing (Jacketed product lines)

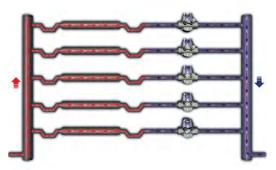

Condensate is removed as it is formed, ensuring maximum heat transfer to the product eliminating the danger of solidification.

Draining high efficiency filters

Rapid removal of condensate ensures optimum filter efficiency.

Condensate removal from platen presses

Fast efficient removal of condensate ensures even platen temperature with reduced risk of product wastage.

Steam Trap Selection and Sizing

Need to Know

- The steam pressure at the trap after any pressure drop through the control valve or equipment.
- The distance the condensate must be lifted after the trap. Rule of thumb: 2 feet of lift equals 1 psi back pressure (approximately).
- Any other possible sources of back pressure in the condensate return system. For example:
 - Condensate taken to a pressurized deaerator tank or flash recovery vessel.
 - Local back pressure due to discharge of numerous traps close together into an undersized return.
- 4. Quantity of condensate handled. Obtained from:
 - Measurement
 - Calculation
 - · Manufacturer's data
- Safety Factor that is dependent upon particular application, typical examples as follows:

Steam Mains 2:1
Tracers 2:1
Non-Modulating 2:1
Modulating over 30 psi* 3:1

Modulating under 30 psi* Size trap at full load and 1/2 psig

differential

How to Size

The difference between the steam pressure at the trap inlet and the total back pressure, including that due to lift after the trap, is the differential pressure. The quantity of condensate should be multiplied by the appropriate safety factor to produce the sizing load. The trap may now be selected using the differential pressure and the sizing load.

Note: The inlet pressure to the steam trap should never exceed the Maximum Operating Pressure (PMO) of the selected trap, regardless of differential pressure.

Example

A steam trap is required to drain 22 lb/h of condensate from a 4" insulated steam main, which is supplying steam at 100 psig. There will be a lift after the trap of 20 ft.

| Inlet Pressure Lift | 100 psig 20 ft. = 10 psi (approximately) |
|-------------------------------------|---|
| Therefore, Differential Pressure | 100 psig - 10 psig = 90 psig |
| Quantity | 22 lb/h |
| Safety Factor | 2:1 |
| Sizing Load | 44 lb/h |

A 1/2" TD52L will handle the 44 lb/h sizing load at a differential pressure of 90 psig.

^{*}TD traps not recommended for modulating service. Refer to TI Sheet for minimum pressure.

The TD52 is a rugged and compact Thermo-Dynamic[®] steam trap that is ideal for steam main drainage and steam tracing systems. It is constructed of hardened stainless steel and available in sizes up to 1". With a broad operating range of up to 600 psig, this trap can meet the wide array of applications found in HVAC and industrial systems.

UTD52L/H

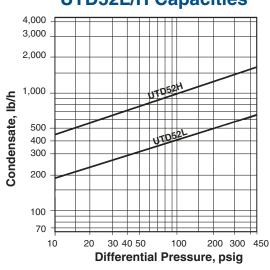

The UTD52L/H combines the rugged TD52 with Spirax Sarco's swivel connector. The result is a Thermo-Dynamic[®] steam trap that can be installed in vertical or horizontal piping. This is ideal for steam main drainage and steam tracing applications where space may be limited. The use of Spirax Sarco's Strainer Connector provides the UTD52 with a permanent, in-line strainer for added protection against dirt and pipe scale.

The TD42, like the TD52, is a versatile and rugged steam trap suited for steam main drainage and steam tracing applications. The TD42 is built with an integral strainer to provide added protection from dirt and scale found in most steam systems. With a broad operating range of up to 600 psig, this trap can meet the wide array of applications found in HVAC and industrial systems.

TD42L/H Capacities

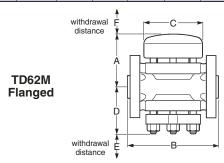

The TD62M is a medium to high pressure Thermo-Dynamic[®] steam trap suitable for steam main drainage and steam tracing systems. The operating range of up to 900 psig makes this trap ideal for many industrial systems where the medium to high pressure steam is utilized. The TD62M is also an ideal choice for superheat applications such as steam turbine drainage. Trap has replaceable seat assembly which allows it to be repaired inline without disturbing piping.

Steam Trap Selection Guide

As the USA's leading provider of steam system solutions, Spirax Sarco recognizes that no two steam trapping systems are identical. Because of the wide array of steam trap applications with inherently different characteristics, choosing the correct steam trap for optimum performance is difficult. Waterhammer,

superheat, corrosive condensate, or other damaging operating characteristics dramatically affect performance of a steam trap. With over 85 years of experience in steam technology, Spirax Sarco is committed to helping its customers design, operate and maintain an efficient steam system. You have our word on it!
